# IR Absorption of 6 mm Thick pH2 Solid

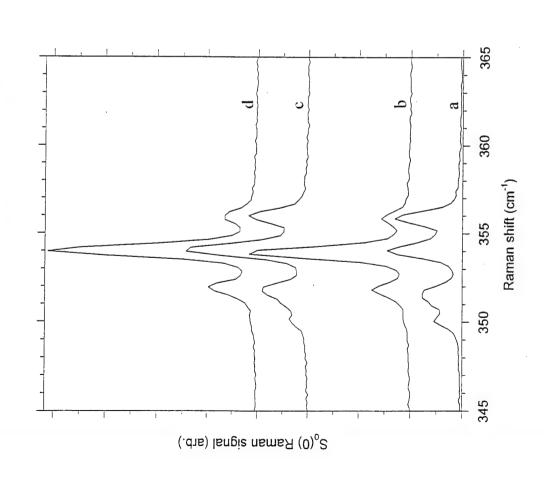

Non-observation of the Q<sub>1</sub>(0) transition demonstrates the absence of oH<sub>2</sub> impurities, and that the microscopic structure is not amorphous or porous.

Observation of  $S_1(0)$  transition demonstrates the absence of inversion symmetry for <u>some</u>  $H_2$  molecular environments.

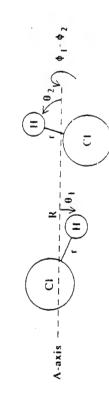

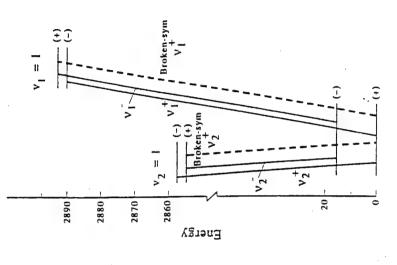

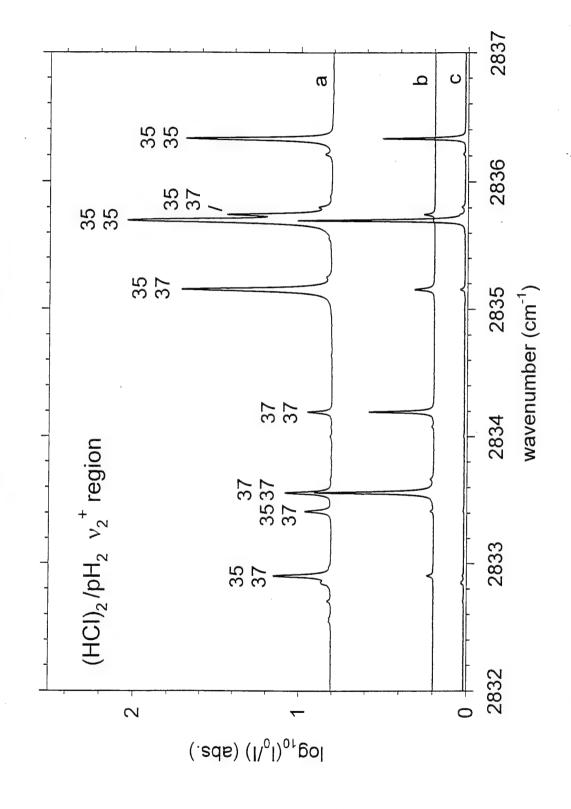

FIG. 1. Vibrationally averaged structure and internal coordinates for HCl dimer. The intermolecular axis R connects the HCl centers of mass. The internal angles,  $\theta_1$  and  $\theta_2$ , are measured from the intermolecular axis to the HCl bonds r. The torsion angle,  $\phi = \phi_1 - \phi_2$ , is shown at 180° (planar). The minimum energy configuration shown is for  $\theta_1 = 16^{\circ}$ ,  $\theta_2 = 87^{\circ}$  with  $\phi_1 - \phi_2 = 180^{\circ}$ . The HCl subunit on the left is referred to as the bonded HCl with an associated vibration labeled  $v_2$ . The proton on the other HCl is not involved with the hydrogen bond, and this subunit is referred to as the free HCl, with a vibration labeled  $v_1$ .

## Comparison with Literature

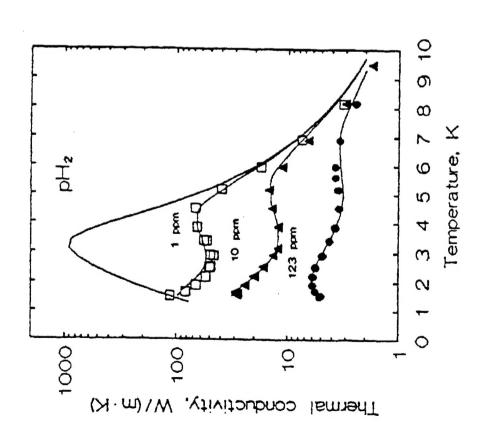

FIG. 1. Thermal conductivity of crystals of pure  $p\,\mathrm{H}_2$  and  $p\,\mathrm{H}_2$  with Ne impurity (the concentration in ppm are indicated); the solid lines are calculated results.

Previous studies on pH<sub>2</sub> solids grown from the gas phase in an enclosed cell near 10 K  $\Rightarrow \overline{\kappa} \approx 4000 \text{ mW/cm-K}$ 

$$\kappa = C \vee L_{ph} / 3$$

[V.G. Manzhelii, B.Ya. Gorodilov, and A.I. Krivchikov, Low Temp. Phys. 22, 131 (1996)]

Suggests  $L_{ph} \sim 1 \mu m$  in our rapid vapor deposited solids.

#### Summary

- Demonstrated production of millimeters-thick transparent pH<sub>2</sub> solids by rapid vapor deposition.
- Demonstrated that vapor deposited pH<sub>2</sub> solids are densest close-packed solids, NOT amorphous. \*
- Demonstrated suitability of vapor deposited pH<sub>2</sub> solids as hosts for high resolution IR absorption spectroscopy of chemically interesting dopants.
- Generalized phenomenon of dopant induced IR activity. \*
- Exploited CO/pH<sub>2</sub> spectroscopy to probe sample temperature during deposition, and to estimate thermal conductivity. \*
